- Operating at 99.95% plus availability

Built in Black Box Optimisation Engine

ROUTEOPTIMISER.COM

Scheduling functionality embedded within your business system or third party software…
The engine can be set up in two ways :-

Evaluate/Re-evaluate

- Level 1 – Calculate an existing fixed route
- Level 2 – Multiple Routes from a SINGLE Depot
- Level 3 – Multiple Routes from MULTIPLE Depots

Dynamic Optimisation

- Level 1a - Sequence a fixed route
- Level 2a - Automatic Multi-Route Optimisation and sequencing from a SINGLE Depot.
- Level 3a – Automatic Multi-Route Optimisation and sequencing from MULTIPLE Depots.

Cost saving: typically at least 10% but often in excess of 25%.

This can arise from :-

- Using less vehicles
- Having the right vehicles at the right place
- Reduction in sub-contract transport costs
- Improved warehouse procedures resulting from optimised route planning
- Improved customer service: your customer gets the delivery when they want it with the right vehicle.
- Improved management control: by linking the sales process with warehousing and transport systems.
- Improved information flow: everyone knows the status of orders at any time.
- Improved reporting: KPIs available on the use of resources.
